

POOL CARE 101

TWICE A WEEK:

1

Use test strips or a test kit to check and maintain your pool water balance. Keep your pH levels between 7.4 - 7.6.

2

Test and maintain the free available chlorine level at 1.0 - 3.0 ppm.

3

Empty the skimmer basket and skim leaves, insects and other floating debris from the pool surface.

ONCE A WEEK:

1

Shock the pool by adding the amount of product recommended by your pool professional. Additional shock may be needed after a rain storm, heavy bather load, or exceptionally hot weather.

2

Add a maintenance dose of an algae preventer to prevent algae growth. Clarifiers and metal control products should be used on a regular basis. The addition of these products will cause your pool to run more efficiently.

3

Brush walls and use a pool vacuum to clean floors. Clean tile at water line with tile cleaner. Or consider the purchase of an automatic pool cleaner for daily "hands-free" cleaning of your pool.

MONTHLY:

1

Take a water sample to your professional Water Testing Service for a complete Swimming Pool Chemicals analysis.

PLUS...

1

Twice a year, clean your filter with a filter cleaner to remove any oils and grease that may have accumulated on your filter.

2

After rainy or windy days always test your pool water.
